Hypoglycemia (Adults)

Blood sugar < 3.9 mmol/l + hypoglycaemic symptoms: Check Conscious Level

Conscious

If patient oriented & able to swallow
Give:

Fast acting **oral glucose 15g**

Followed by **long acting carbohydrates**

If patient disoriented & unable to cooperate
Give:

IM/SC
GLUCAGON 1mg

Unconscious:

Call Ambulance
Check ABCDE
Give:

IM/SC

GLUCAGON 1mg

OR

IV 50ml 50%Dextrose

SE: nausea and vomiting → put the pt in recovery position

- **Remeasure blood glucose** after 15 minutes and repeat treatment until blood sugar **> 4 mmol/l**
- If patient on **Sulfonylureas: Refer** to Hospital in spite of correcting blood
- If **child is unconscious or unsafe to take oral carbohydrates**, IV dextrose should be administered: **Initial bolus - 2 mL/kg of dextrose 10%** (0.2 g dextrose/kg body weight), If glucose fails to increase after 15 to 20 minutes, repeat bolus. Higher concentrations of dextrose are not recommended as an initial bolus
