Loss Of Consciousness

Assessment

- Call **ambulance**
- Put the patient on the **recovery position** (unless history of possible spinal injury)/ neck stabilization.
- Check **ABCDE**
- Check the **GCS/ FOUR score** (eye/motor/brainstem reflexes/respiration)
- Check **RBS**
- Check **pupillary light reflex**
  - Constriction: Opioid/cholinergic
  - Dilatation: Cocaine, amphetamines, caffeine, TCA, antihistamines, benzodiazepines, barbiturates, alcohol, SSRIs
- Insert an airway
- Gain **IV access** (2 large bore iv cannulas)
- Attach **BP monitor, pulse oximeter ± ECG monitor/AED**

Management

Give:

- **Oxygen** (15L/min) to maintain peripheral oxygen saturation (sat 94–98% or 88-92% if known to have Hypercapnia).
- **IVF**
- Treat the underlying cause:
  - If **Opioid overdose**: Naloxone (0.4 -0.8 mg IM)
  - If **Hypoglycemia**: Check Hypoglycemia protocol
  - If **Hyperglycemia**: Check Hyperglycemia protocol
